PROFILE

Senior full-stack software engineer and technical lead with five years of experience building customer-facing applications and backend services with React, TypeScript, JavaScript, Node.js, GraphQL, and AWS. Leads technical delivery with engineers, customers, and product managers, from discovery and architecture through implementation and launch. Supports a 45-client membership portfolio representing more than \$100M in annual recurring revenue in 2025.

TECHNICAL SKILLS

Frontend	React, Redux, TypeScript, JavaScript, HTML, CSS
Backend & APIs	Node.js, GraphQL, REST APIs, DynamoDB
Cloud & delivery	AWS Lambda, SQS, S3, AppSync, Terraform, CI/CD, Observability
Additional language	Java

EXPERIENCE

Anchor Operating System Jul 2021 - Present

Senior Software Engineer Jan 2024 - Present

- Led technical delivery for San Diego Zoo Wildlife Alliance's membership implementation, planned for August 2026. Worked directly with client stakeholders and product managers on discovery, scope, architecture, design reviews, engineering assignments, and launch planning.
- Designed and shipped full-stack membership purchase, renewal, and account-management flows across customer-facing React applications and Node.js/GraphQL services. Delivered checkout, member portal, upgrade, and stored-payment features in a large, complex codebase.
- Built Fetch Membership, the service used for member accounts, card issuance, benefit validation, ticket redemption, and admission check-in. It routes to V1 and V2 membership stores with 2.3M+ non-overlapping records.
- Designed V2's DynamoDB model with eight entity types and 7M+ items. Added controls for version routing, tiers, benefit rules, and launch setup. Replaced 20+ daily cron jobs with lazy benefit evaluation, reducing DynamoDB reads by about 40%.
- Added duplicate-payment guards, retry jobs, and refund handling for downstream fulfillment failures, saving at least 16 hours each week across client operations and internal teams. Across prior membership launches, purchases and renewals rose 38.4%, while manual processing, support tickets, and payment failures fell 46%, 79%, and 63%.

Software Engineer II Jun 2022 - Jan 2024

- Built a cart state engine spanning the checkout UI and backend services, allowing API-driven updates during an active session without resetting customer progress. Consolidated booking flows into atomic service calls and led integration-test work adopted across core API services.

Software Engineer Jul 2021 - Jun 2022

- Designed an itinerary bundling service used across platform orders and built an automated integration-test foundation adopted by core API services.

EDUCATION

California Lutheran University 2019 - 2021
M.S. Information Technology, Graduate Scholarship

BNU-HKBU United International College 2012 - 2016
Bachelor of Business Administration in Finance
